# **BIA-660 Web Mining Project**

### **Web Scraping Goodreads Website**

#### **Project Title: Recommendation System**

The link for the website: www.goodreads.com

#### **Objectives:**

Our project for BIA-660 Web Mining is going to focus on "Goodreads Books". We started this project to solve both a Business problem as well as to satisfy the user needs. This project focuses on the following:

- Categorizing the books using the classification methods (Naive Bayes, Support vector machine (SVM) & KNN), when a new book is added to the database, our model predicts which category the book belongs to.
- Recommending books to the user based on user reviews (Category Based Review Based).

## Scraping the tags (Categories) & Links

Initally, we are scraping the 29 tags (categories of the books) and their links to go inside each category and browse for the books which belong to that category.

- Using BeautifulSoup to scrape the data from the Goodreads website.
- Using "Request" library to retrive the source code.
- Initializing a function called "getCategoryHref" to get the Cetegory links.
- Writing the contents to the "categoryListGR.csv" File.

categoryListGR.csv

```
In [ ]:
```

```
def getCategoryHref(url):
   page = requests.get(url, headers = headers)
   if page.status code == 200:
        # initiate a beautifulsoup object using the html source and Python's html.parser
       soup = BeautifulSoup(page.content, 'html.parser')
       hrefTag = soup.select('div#topRow > div.cell a.listTitle')
       for href in hrefTag:
           finalHref = siteUrl + href['href']
           break
       return finalHref
if page.status code == 200:
   soup = BeautifulSoup(page.content, 'html.parser')
    print(soup.prettify())
   categoryNameTags = soup.select('div ul.listTagsTwoColumn li a.actionLinkLite')
   for name in categoryNameTags:
       print(name)
       categoryHref = getCategoryHref(siteUrl + name['href'])
       category[name.text.strip()] = categoryHref
   with open('categoryListGR.csv', 'w') as file:
       wrt = csv.writer(file, delimiter=',', lineterminator='\n')
        wrt.writerow(['Category', 'Link'])
       for key,value in category.items():
           wrt.writerow([key,value])
```

## Fetching books from each category with their Scores and Links

Each category from the previous step is called for and the data for the first 300 books are scrapped. This dataset includes Category, Names, Links and Scores attributes.

- Creating a List each attribute and combining them to form Pandas Dataframe.
- Using categoryListGR.csv file to fetch the data of the inidividual book.
- Writing the contents to the "categoryBookFile.csv" File.

```

#### Getting the contents of the books

The content of all the 300 books of each category is taken and stored in a csv file.

- Reading the entire csv file, fetch the movie links columns and convert it into list.
- Iterate each movie links from the list and fetch book contents such as Name, Author Name, Author profile link, Ratings, Awards, Descriptions and which other category it belongs to.

entireBookList1000.csv

```

- Using pos tag to. understand the part of speech.
- Using Regular expression to fix a pattern.
- The tokens are lemmatized.
- Constructed the TF IDF matrix for the Description category of 8700 books.
